* Triple bank marine charger

Battery Cycling (Definition) - In situations where one is not quite sure whether the application is cyclic or standby (float), the following criteria may be used to determine the application category: If the average time on charge between two successive discharges is thirty (30) days, the application may be considered to be of a standby (float) nature. The minimum time between two successive discharges must not be less than fourteen (14) days. If either of these two criteria is not satisfied, the application should be considered cyclic.
